

ABSTRACT OF THE DISCLOSURE

A quick release mud flap apparatus includes a flexible panel having
5 a bottom end and a top end. A rigid bracket is attached to and extends
along a length of the top end. Each of a plurality of clamps is attached to
the bracket and extends upwardly away therefrom. The clamps each
include an actuator for selectively opening or closing the clamps. Each of
the clamps are closed when the actuators are in a downward position
10 located generally adjacent to the bracket and open when the actuators are
spaced away from the brackets. The clamps are each selectively coupled
to a floor rail such that the panel functions as a mud flap. A locking
assembly selectively locks the actuators in the downward position.
